Samsoftpay x XY Vending - Integration Spec

Scan-to-pay -> dispense. The machine shows a Samsoftpay QR; it never touches money or cards.

What the payment method is

Samsoftpay is a payment gateway in Uganda. The customer scans a Samsoftpay QR shown on the machine and completes payment on their own phone, choosing their method on the Samsoftpay page (Mobile Money today; more methods such as Airtel and cards are added centrally, with NO change to the machine). No card, no cash, no bank data on the machine - the QR opens Samsoftpay's secure checkout page.

Business process / how the consumer proceeds

1. Select product	→	2. Machine shows QR	→	3. Scan & pay on phone	→	4. Samsoftpay confirms	→	5. Machine dispenses

XY engineering's three questions, answered

1. What is the payment method?
A Samsoftpay QR. The customer pays on their phone (Mobile Money today; Airtel and cards added centrally later, with no machine change). The machine only displays a QR and dispenses on success.

2. What is the business process?
Select -> QR -> customer pays on their phone -> Samsoftpay confirms -> machine dispenses (the 5 steps above).

3. How does the consumer proceed?
Scan the QR with the phone camera or a payment app -> choose the method and confirm -> approve on the phone -> the machine dispenses. No app install, no card or cash at the machine.

How to connect to the Samsoftpay API

Base URL https://api.samsoftpay.com | Auth: header Authorization: Bearer <key> (use the LIVE secret key sk_live_... in production; sk_test_... for the sandbox).

1) Create the order + QR: POST /v1/vending/orders (or POST /v1/payment-links) -> returns a QR image URL to show on the machine. 2) Know it is paid: set your Webhook URL + copy the signing secret (whsec_...) in the dashboard; we POST a signed charge.succeeded event to you (or poll GET /v1/charges?reference=...). 3) Dispense-result (XY -> us): POST /inbound/xy/dispense-result.

Sandbox vs live - simulate or real (read before testing)

The API KEY PREFIX decides the mode. sk_test_ = SANDBOX: charges auto-complete instantly with NO real PIN prompt and NO real money (safe testing of the scan-to-dispense loop). sk_live_ = LIVE: the customer gets a real PIN prompt and real money moves before we confirm. Every charge/webhook carries a mode field ('test'/'live') - in production, only dispense when mode is 'live'.

What is needed to finish (the Samsoftpay side is already built)

Option 1 (recommended): our software on the machine board (VMC) creates the order, shows the QR, and sends the dispense command after payment. From XY we need only the VMC + its serial command/protocol document. XY builds NO payment or QR logic.

Option 2 (XY cloud dispenses): after payment our backend calls your ApplyExportGoods API and the machine POSTs the result to our callback. Already built our side; needs the machine registered on your cloud + XY key/secret/merchant-number.

Dispense-result callback: https://api.samsoftpay.com/inbound/xy/dispense-result | API docs: https://api.samsoftpay.com/docs | OpenAPI: https://api.samsoftpay.com/openapi.json
