

Samsoftpay x XY Vending - Integration Spec

Scan-to-pay (MTN Mobile Money) -> dispense. The machine shows a QR; it never touches money or cards.

What the payment method is

Samsoftpay is a payment gateway in Uganda using MTN Mobile Money (MoMo). The customer scans a QR shown on the machine and approves the payment on their own phone. No card, no cash, no bank data on the machine - the QR opens Samsoftpay's secure checkout page.

Business process / how the consumer proceeds

XY engineering's three questions, answered

- **Payment method?** MTN Mobile Money via a Samsoftpay QR. The machine only shows a QR and dispenses on success.
- **Business process?** Select -> QR -> customer pays on phone -> Samsoftpay confirms -> machine dispenses.
- **How does the consumer proceed?** Scan QR with phone camera / MoMo app -> confirm number -> approve with MoMo PIN -> dispense. No app install.

What is needed to finish (Samsoftpay side is already built)

Option 1 (recommended): Samsoftpay software runs on the machine control board (VMC). It creates the order, shows the QR, and after payment sends the dispense command. From XY we need only the VMC hardware + the serial command/protocol document (bytes to dispense a chosen slot and read status). XY builds NO payment or QR logic.

Option 2 (XY cloud dispenses): after payment, Samsoftpay's backend calls your ApplyExportGoods API, and the machine POSTs the dispense result to our callback. Already built on our side. Needs: machine registered on your cloud + XY key/secret/merchant-number. (Even here a small on-board program starts the order, since your cloud has no machine-initiated 'start order' interface.)
